

Patch and Asset Management

Why Heimdal?

Heimdal offers an end-to-end, proactive, unified cybersecurity suite built to defend against next-gen threats.

The unique, multi-layered approach provides comprehensive protection across all areas. Through Heimdal, you can experience advanced protection across your organisation, from endpoints and networks to emails and beyond.

The challenges Heimdal's Patch and Asset Management solves

Vulnerability management is an ongoing challenge. As technology constantly evolves, staying on top of patch and asset management is essential. Managing it yourself brings risks like limited endpoint visibility and the complexity of maintaining different systems and applications.

Heimdal's Patch and Asset Management modernises patch management across any business, providing full software inventory visibility through one powerful platform. The fully customisable solution supports over 200 third party applications, including Chrome and Adobe.

Patching schedules can be designed around your needs or fully automated. Either way, you'll have full visibility into software inventory, compliance reporting, OS-level software control, user-approved installs, and flexible update timing.

Benefits of Heimdal's Patch Management

Enhanced productivity

Simple, stress-free management keeps teams in control to focus on other key areas of your business.

Maximum security

Patches deploy in under 4 hours, the fastest in the industry, with all packages encrypted prior to delivery.

Time saving

Eliminates manual patching and reduces the workload for your IT team.

Compliance

Ensure you're compliant with industry regulations, including GDPR, CIS18, NIS2, Cyber Essentials, and more.

Streamlined processes

Proactive, automated patch deployment simplifies patch management.
